

T15, The main trunk is covered in ivy making it hard to carry out a visual inspection. The tree's upper canopy is in good health.

T16 & T17, Upper canopy's of both trees are in good condition

T18, The trees upper canopy looks to be in good health with plenty of vigour over the garden of property No 50.

T19, Large most southerly willow with ivy up the main trunk. The canopy has been pruned back on the east side. It has responded with good vigorous regrowth over the garden of property No 50.

Recommended Works: All these trees have been subject to previous canopy reductions in the past. They have all responded to the previous pruning. The canopy height and lateral spread/regeneration from the last prune, is on average, approximately 1 mtrs in length. Out of the above 19 trees, none need felling.

**Crown reduce and prune back lateral spread on all the remaining trees by 1 mtrs.
Remove all major dead wood.**

On T7, there is a large south-westerly limb in the upper canopy with a structural weakness. Inspect when works are carried out. Reduce this limb by 2 mtrs if needed.

T8, A canopy reduction as mentioned above will stabilise this tree. I am not concerned about the large cavity above the gate. There is good reactionary growth around it.

T18 and T19, Prune back the easterly spread by 2 mtrs to balance.

Sever all ivy to enable further visual inspections of the trees.

If you require more details they will gladly be provided.

Yours sincerely

John Bentley NDARB
