Hi Susanna,

I would agree with the 25% crown reduction on the sycamore, any less than that and it would only need reducing again in 18-24 months. The cavity does concern me, it is situated in such a way that it can collect water which will speed rotting of this area and encourage infection. It may be that they instruct a survey of this tree before allowing any work to be carried out, it depends on their opinion of the picture.

With regards to holm oak, I see no reason why a canopy lift can't be authorised, removal of this lower epicormic growth will not harm the tree, it will serve to improve light into the building still leave a full well balanced crown. In terms of exact measurements it's hard to say without giving a rough estimation of the gutter height level. This is something you should be able to do on site.

Hope this was some help

Best regards

Brad
