

I have had T&P Tree Surgeons outline what needs pruning now.

(1) The first is the tall Scots Pine in the corner at the back of the property, which has a distinctive fork in it, and a 18/20 ft leader to the Right. That needs cutting off to the fork. The weaker stem to the left, which needs 2/3 cutting off, and the remaining 1/3 will revive as the new leader.

(2) The next is the Bay tree between the Scots Pine and the Eucalyptus, which should ideally cut down to Hedge Height, and if that isn't possible 8ft, which like the Scotch Pine, hasn't been touched for some years, if ever by professionals.

(3) The Eucalyptus has already grown back so much since the last time it was pruned. I would like to pollard the tree as has been done previously, which my experts tell me is possible, and tidy off all the recent growth smooth again, meaning we have a completely fresh start again.
