Oak Tree (T1) at 7 Oak End

Introduction

This tree has been pollarded in the past however it is clear that it has been some time since any maintenance work has been done. Lapsed pollards can pose increased risk because the points of attachment are weak compared to a tree which has not been pruned in this way.

Proposed work

Crown reduction by 2m.

Arboricultural Implications

Crown reduction would improve the appearance of the tree. Cutting back to correct growth points and selectively thinning out the pollard points will lead to a more natural shape.
