Dear Sarah

Thank you for getting me over to take a look at the trees around your garden today

I report on the following trees, T1, T2,T3,T4, T5, and G6

T1,T2, T3 and T4 - are a group of White Poplar trees. T1 is dead and T2 is on its way out. It is difficult to know what has caused this to these two trees. It is most likely a fungal issue which has been brought on due to the stress the trees have recently been under. Flooding this winter gone, followed by drought this spring/summer. Unfortunately, these two trees will need to come down. T3 and T4 are not showing signs of die back and although you asked if they can be pruned, I am hesitant to do anything to them for now. Pruning may shock them into decline. If the two trees are in good health in two years, that may be a safer time to prune them.

T5 - Mature multi stemmed self-seeded Sycamore by the fruit garden. If you wish to improve on the fruit garden and may be, introduce some young fruit trees into this area, I recommend this Sycamore is felled.

G6 - South boundary Leylandi hedge/tree line. These trees need reducing by approximately 4 Meters in height. This will prevent them from snapping out, as has happened recently.

I hope the above advice is of help. Please don't hesitate to get in touch if you have any questions.

John Bentley ND Arb
