Tree Survey - K. Wymbs, Tree surgeon

Summary of conversation with Mr Wymbs following survey of the mature Holm Oak to the rear of the property. The survey was conducted on Tuesday 28 July 2020. No formal report provided.

The tree is badly diseased, structurally unsafe and has outgrown its proximity to the dwelling. There are signs of disease to the inner core and external signs of fungal growth. Previous storm damage and pruning has left many of the remaining branches structurally unsafe and seriously limits the extent of further pruning.

Photographs showing areas of disease are shown in following pages.

The recommended course of action is to fell the tree and replace with one healthy tree of a species more appropriate to the location, e.g. a Himalayan Birch.
