Tree Survey - K. Wymbs, Tree surgeon

Summary of conversation with Mr Wymbs following survey of the two mature Holm Oaks to the rear of the property. The survey was conducted on Monday 26 June 2017. No formal report provided.

Both trees are badly diseased, structurally unsafe and have outgrown their proximity to the dwelling. There are signs of disease to the inner core and external signs of fungal growth. Previous storm damage and pruning has left many of the remaining branches structurally unsafe and seriously limits the extent of further pruning.

The recommended course of action is to fell both trees and replace with one healthy tree of a species more appropriate to the location, e.g. a Himalayan Birch.
