Report supporting recommended Tree Pruning and Removal in your garden

Dear Martin

Thank you for inviting me to take a look at your Trees within your rear garden.

I report on the following trees

T1 – Mature English Oak situated on the side of the ditch line which runs along your rear west boundary. This tree's trunk and buttress area show no signs of fungal fruiting bodies and there are no cavities or presence of decay. The tree's upper canopy does look sparse in areas and supports some major dead wood.

T2 – Mature London Plane tree growing close to the garden building. This tree has an impressive Large spreading canopy. The tree is in good health and in full vigour. Within the canopy there are dead limbs where the tree's outer canopy has shaded out inner growth.

T3 – Mature English Oak small in structure and 90% dead.

T4 – Dead Mature Silver Birch tree.

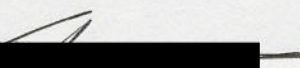

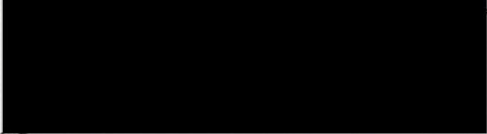

T5 – Mature Silver Birch which is dying back.

G7 – 7 Self-seeded Semi mature Sycamore trees. These are all growing along the ditch line.

Recommendations : T1 – Remove all major dead wood. T2 – Remove all major dead wood. T3 – Fell. T4 – Fell. T5 - Fell. G7 - fell all 7 stems/Sycamore trees to improve light levels within your garden.

If I can be of further help please do get in touch. All above work will require approval from ADC.

Yours sincerely

John Bentley (NDarb)
