

Lighting will be kept to an operational minimum on the site. The showroom will be gently lit for the adequate display of sales vehicles for visibility and security purposes.

There will be external security sensor lighting to the side and rear of the building but these will be in operation only intermittently. The car park area serving the workshop to the north will have subdued lighting all night which supports CCTV necessary for the security of the vehicles. This will take the form of pole mounted lighting which will evenly distribute light over the area in accordance with the details as shown on the Artemide External Lighting layout drawing, reference K7795r2-EXT Audi Worthing Model (1) ARTEMIDE.

External lighting will be provided to the used car display areas and to general circulation areas of the site, in accordance with the details as shown on the Osram Ltd lighting drawing, reference CRM-182217-Audi-Worthing-Exterior-Rev02 OSRAM. The lighting will provide the levels of illumination as shown on this drawing up to 11pm, and after that time the levels of illumination will be reduced to a level for security purposes only.

The use of lighting has been carefully considered and respects the residential properties to the west by being timer/sensor operated wherever possible and using pole mounted lighting which is necessarily angled down and away from adjoining occupiers.

An illustration of similar Audi dealership lighting is shown below. The photograph shows the use of low level lighting in the showroom and external security sensor lighting which is discretely located around the showroom building.
