Dear Rob Jones,

David Utting engineering are the designer and manufacturers and the rental company for the Smartshop facility. Currently we have over 400 units across the UK and Southern Ireland.

We have attached particulate and influx velocity data, both of which meet the requirement of the environmental protection act for the refurbishing of road vehicles. Regarding odour abatement, of the 2 types of paint used in the refurbishing of vehicles are either water based base coat, or a high solid low VOC both of which have very low odour properties. Therefore, combined with a duplex 2 stage filter addition odour abatement is not necessary, the same as the 400 locations there has never been a requirement for odour abatement. Furthermore, in the extremely unlikely event odour control becomes necessary, the first option would be to increase the discharge height, however this could lead to visual intrusion to the neighbouring properties which should not be necessary, especially taking into account the current safeguards including particulate emissions, influx velocity and duplex filtration.

Yours sincerely,

David Utting

Director
