

## GENERAL NOTES

the entire set of results, then giving an overall necessary conclusion. Dimensions, those not falling into any of the categories, are subjected to a survey. All dimensions are then grouped into the three categories: *Primary problems*, *All dimensions* and *Not in the model*. On the other side of the coin is *Primary problems*. The reason is to be able to compare the different dimensions and/or specified organizational dimensions and discrepancies in variables to be studied, to be analyzed based on the different variables. All dimensions that do not fall into the categories, those also not having a classification, are to be analyzed in the second category, considered by results.

The researchers of this study used a 5-point Likert scale that comply with the recommendations of Johnson-Strauss (BSI 2000), ranging from +1 to +5. All ratings and conclusions to be in accordance with the Copenhagen Design and Management Studies 2007.
