Dear Ms Moore,

I've just measured the current spread of the tree, and the results are as follows:

The maximum spread is along the North/South axis and is 11.8m

The proposal is to take 1.5m from each of the North and South sides, which would leave a final spread of 8.8m

However, the object is also to achieve a more balanced appearance to the tree, so I would propose to take a bit less off the East/West axis, in order to leave the tree as symmetrical as possible, and with a final maximum spread of at least 8m, which I believe is normal for a 12m tall yew tree.

I hope this is sufficient, but if you need to know anything else, please don't hesitate to ask.

best regards, Peter Mullans
