Dear Maria.

I received an email from Dan Champion dated the 15th July 2020 in that email he says (firstly, for a pump station to be adoptable to Southern Water standards, it needs to go through a period of 3 months without any faults. Unfortunately, the pump station that was built by Barratt homes failed every time and was always over the EA maximum level criteria) when he says pump station we assume he means sewage treatment plant installed at Upton Brooks by Barratt David wilson homes.

It would appear that going by what he has said the sewage treatment plant has never worked and has not been fit for purpose from the day it was installed the residents of Upton Brooks moved into properties that had a faulty sewage treatment system.

He also says (the area of Barnham road and Elm Grove South is part of the Lydney Growth Scheme which is currently being modelled by our designers.

This will identify if any upgrade work is required in that area and a solution for taking any additional flow.

This will ensure that the system can accommodate all flows in that area and no issues occur.

We think that by this he is saying there is currently not cappacity in the sewer at this present time and the sewer system will be upgraded in the future, if this work is required, he has not specified a time when it will be done, the problems with the sewer in Barnham road was highlighted in the planning application Eg /29/13 the original application this was also stated by the Environment Agency.

yours sincerely Mr B.Barbary (Elm Grove South residents association, Barnham road and Upton Brooks residents)
