

Design And Access

The mezzanine will be constructed from an expanded metal sheet similar to the example below. This will be painted black and be sympathetic to the existing timbers and metalwork surrounding it.

The mezzanine will be suspended from the two main wooden beams and supported by angled brackets that rest upon the beams. There will be no fixings and the existing fabric will be unaffected.

The mezzanine can be easily removed if required and the removal will have no effect upon the existing structure and fabric.

The purpose of the mezzanine is to gain access to the window for both cleaning and maintenance purposes.
