Hi

After my site visit the other day I would recommend the following.

T3 poplar tree- I would recommend to fell the whole tree down to a stump or at the least remove leaning stem over 26 songthrush lane.

It seems to have been pruned back at some point however speaking with residents it has still been lowering gradually in the last 18 months. In recent storms we have been called out to make safe numerous trees along this boundary that have fallen and damaged property. I think it would be the best action to undertake this work to help prevent future damage and reduce risk to residents.

T8 alder tree- Fell down to a stump or at the least reduce the height to reduce weight in the crown. In the last 18 months the tree has gradually lowered closer to the ground, as it is over a public pathway it would be recommended to undertake work to prevent any danger to public.

T4 poplar tree- due to recent storms that have caused damage to neighbouring trees I would recommend reducing the height in the tree by 2-3 meters to suitable growth point to keep the tree at a sensible size as it is within close proximity to resident houses.
