

New specimen tree planting is proposed throughout the scheme; helping to break up / frame the development; providing wildlife and visual amenity benefits. Species would be carefully chosen to reflect the local landscape character and its environs.

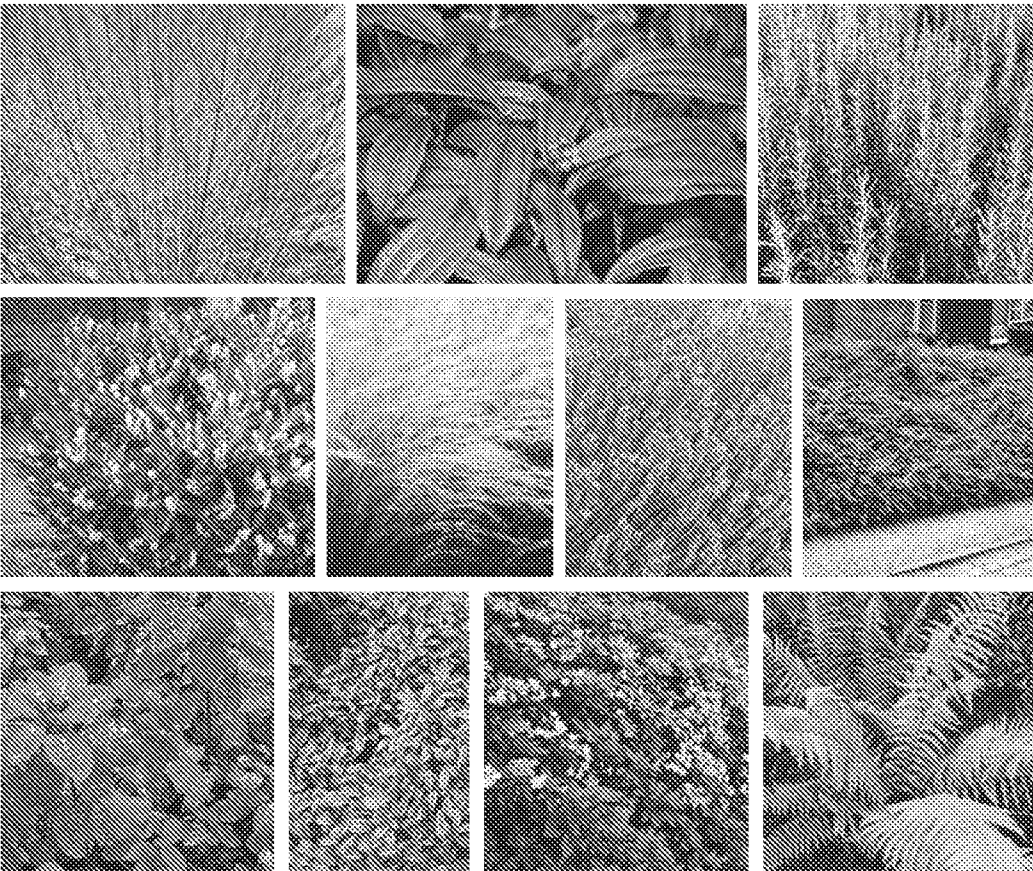

Mixed native hedges would be used to create a strong landscape framework for the development planted along the site perimeter.

Low ornamental hedges will be used to break the garden into comfortable 'rooms' and provide a buffer to the car parking areas.

Marginal grass / wildflower planting will be seeded within SuDS areas and along the eastern boundary transitioning to the adjacent woodland copse providing habitat for insects, small mammals, birds, amphibians and reptiles.

A mix of low maintenance shrubs, groundcover and climbing plants would be used to provide an attractive setting to building frontage / garden areas.

Wellness garden
