

We will run pre-insulated pipe from the ASHP unit, under the garden wall, across the lawn and up through the patio area to then connect up inside.

We will cap off the oil supply, remove the oil boiler, modify the internal pipe work as required, install a buffer tank where your existing boiler is, and connect the new ASHP via the buffer tank to your existing

radiator circuit.

The domestic hot water cylinder will be removed and replaced with a new 250 litre Heat Pump hot water cylinder so that the heat pump can also provide all your domestic hot water.

We will carry out all mechanical and electrical work in order to complete the installation.
