

Method Used to Measure the Soil Infiltration Rate

The procedure as described in BRE 365 to determine the soil infiltration rate was used. The trial pit being .6 metres wide by 1.3 metres long by 1.5 metres deep. An infiltration rate of _____ was calculated.

This infiltration rate was then used to calculate the storage volume required (please see enclosed calculation sheet).

The procedure was carried out in December 2013. The trial pit was subsequently monitored monthly until summer 2016.
