Hello Simon

Further to our telephone conversation please find attached updated drawings. As you will see the ramp is now just 33 metres which is exactly the same as the adjacent storm water drain.

After some considerable thought I find it hard to understand the reason for this change, from my point of view I cannot see that it would have any effect on the local environment, however what it will do is to increase the slope of the ramp by 10% - as you will know this ramp is in the public domain and is there for anyone to use. I have tried my best to make the slope of the ramp to be as little as possible in the public interest and so to sum up I suggest we ask the question "why?".

Just one further interesting point to make, following heavy rain the outflow from the storm water drain at low tide carves a channel in the sand close to the breakwater and would not come anywhere near the ramp.

If at the end of the day we have to concede so be it

If you require any further documents or amendments please let me know and I will come up with them in the new year

Best wishes
Joe

PS It may be an idea to have a quick word with our colleague at ADC Roger Spencer
