Tawny Owl Nesting

Tawny Owls don't build nests but use holes in trees, especially the hollow ends of large broken branches. Sometimes they will use the abandoned nests of other birds and even squirrel dreys. In areas with a good supply of prey but few trees, Tawny Owls may even nest on the ground.

Tawny Owl Box

Ideal size 9" x 9" x 35" (22 x 22 x 88cm). These chimney-style boxes replicate the hollow ends of large broken branches. The Raptor Trust recommends they should be sited in exact locations at least 2.5m (8ft) above ground and can be fixed in or to trees, or wedged into the side of trees. Ensure that no nails, screws or other sharp edges or points are left to protrude into the box or any part on which the birds might perch.

Schwegler 2F Bat Box

The 2F is the simplest design with a narrow front access slot. A general purpose box suitable for smaller British bat species including Pipistrelle, Long-eared and Daubenton's bats.

33cm high x 16cm diameter

Notes

Owl and bat boxes to be installed in mature trees under supervision by site ecologist following completion of main tree surgery work and before commencement of development.
