Dear Paul

Thank you for getting me over to take a look at your Large Monterey Cypress - T2 (Macrocarpa) by your front entrance - Approximately 23 to 25 meters in heights

I have checked around the base of the tree and visually checked the main trunk. There are no signs of movement in the root plate and no signs of fruiting fungi, there are however multiple broken limbs throughout the trees upper canopy. I recommend these damaged and broken limbs are removed. At the same time, the remaining tree's branch structure can be brought back in to try and reduce the risk of further limb damage/loss. The two limbs of most concern being one that grows north towards the main road and one which grows east over your drive entrance.

Recommended Works - Reduce and reshape the entire tree by approximately 20% (where growth allows) This will leave the tree at a final height of approximately 18 to 19 meters. And with a crown spread of approximately 4 to 5 meters in places. The removal of damaged limbs will in effect thin out the tree's canopy by approximately 15%.

If the above is carried out, this tree should be good for many more years to come. Please do get in touch, if I can be of any further assistance.

John Bentley (NDarb)
