Good morning Nicola,

in response to your request for further information regarding the proposed tree works as above.

The reduction in height of the canopy is planned at 4 - 5 metres guided by the suggested pruning points shown in the Bournetrees Report, photographs pages 25-28.

Reduction in spread is estimated to be around 2 -3 metres, again guided by the inspections and advice given in the two reports.

Overall estimated area leaf area reduction is up to around 25%.

These are not exact measurements as the intention, over a period of time and with appropriate monitoring and gauging the trees response to staged prunings is to give the tree the best chance of survival given the points raised in the reports regarding the fungal growth and areas of concern within the trunk and lower stems.

Initial key action, as advised, at present is to ensure the size of the crown does not exceed the structural strength of the lower stems, by thinning and lowering the upper crown structure whilst retaining a high percentage of foliage.

I hope this clarifies the points raised, should you wish to speak to me I can be contacted

Regards
