

REASONS FOR PROPOSED TREE WORK

T1 Horse chestnut along the west fence line:

- Sectional fell

The tree is in terminal decline with only c.35-40% live crown remaining.

*Fructifications of the decay fungus *Ceriporus squamosus* are present along the main stem indicating decay is present and with Horse chestnut's poor ability to compartmentalise decay, further deterioration of the stem is inevitable*

The intention is to remove the tree, grind out the stump and make ready for a replacement tree – the species of which has yet to be decided
