

Arboriculture report

After a visit to 77 Downview Road, it was clear as to why the client wants the work done to the Atlantic cedar (T1) in the back garden. The whole garden and rear rooms of the house are in complete shade for most of the day, due to an over-dense crown. The outer crown is overpopulated with recent years epicormic growth which is in need of reducing back to previous reduction points to allow more light through the tree and into the inside of the property.

Also, the Norway Maple (T2) in the front garden is in need of a rebalance due to the neighbours cutting their side right back to the main stem, this in turn has made the tree completely one sided and at risk of being uprooted in high winds once in leaf. It was recommended to the client that it is to be pollarded which will allow the tree to rebalance and have even crown growth.
