

ARN011

- A) The clip from Maps below shows the location of the existing pole. We can see that the pole is installed on the south side of the tree cover, which is the opposite side to the housing. This will afford excellent screening. We are keen to make the best of this cover a well.

- B) To do this we are looking to install the new replacement pole as close to the existing as possible. To do this we are keeping it in line with the pole that is being removed. The clip from the drawings shown below show the proposed and existing poles closely sited and directly in line, still south of the treeline. There will be some branches that overhang that new location and a few of those might need to be removed, but these will be kept to an absolute minimum.

- C) The below snip shows the location of the existing pole and an arrow pointing to where the new pole will go. Note mostly low level scrub to the removed, most of which will grow back post install.
