REASONS FOR PROPOSED TREE WORK

T2 Horse Chestnut along footpath fence line (third tree from southern end of row):

- Sectional fell

The tree has a large cavity running into the stem and rooting system along with decaying wood around the southern and south western aspect of the main stem up to a height of approx 1.5m.

The location of the tree is adjacent to queuing traffic when the level crossing barriers are down; any failure would cause significant damage to the parked vehicles waiting to cross the railway line
