Dear Simon,

Any external lamp described as a 'downlight' could potentially be turned into an 'uplight'. It only means that the lamp is single directional instead of multi directional. The lights would be fixed to the wall in a downward position since, being shaded, they could not fulfil their safety or security functions if they pointed upwards. We are happy to have this specified as a condition of any approval. Beyond this we unfortunately have limited control over the behaviour of potential future residents.

I have attached details of an alternative downlight, which the applicant would be equally willing to use if you prefer the design.

Kind Regards,

Jennie
