REPORT NAME: Technical Summary – Surface Water Drainage Design

DATE: 03/06/2020

REF: DSM/E4761/17683

Introduction

This technical note has been produced to provide summary of the detailed surface water design, which collates the key design principles applied to the design following previous correspondence with the Drainage Officer during the application of the Reserved Matters stage.

Surface Water Drainage Design

The detailed surface water drainage strategy was developed in consultation with Laura Gibbons (ADC Drainage Officer at the time) during 2019, this also included agreeing extents of proposed testing for soakage testing and groundwater monitoring on site which the results are provided in the following documents:

- BRE 365 Soakaway Testing by Geo-Environmental Limited (January 2019);
- Winter Groundwater Monitoring by Geo- Environmental Limited (June 2019);

The outcomes of the additional groundwater monitoring has informed the base levels for both attenuation basins as well as to inform a surcharged outfall scenario used in the MicroDrainage Calculations when simulated peak storm events. The maximum groundwater level observed based on the testing and site levels has been taken as 4.080mAOD.

Registered office & business address as above

Following consultation with Laura Gibbons, it was agreed that the attenuation basins with base levels varying between 4.0m and 4.20 respectively would mitigate the need for lining to the attenuation basin, and by ensuring that the hydraulic simulation included a surcharged outfall of 4.08m, this ensured that the system would be simulated with the affect of a potential high groundwater level (at a level of 4.080m) within the system itself and to ensure only available attenuation above this level is accounted for in the calculations.

Previously during the Reserved Matters stage, we submitted two sets of calculations to simulate the impact to the system both with and without the impact of the upstream Crayfern Development at unrestricted rates, and by allowing for an overflow weir at the final manhole to allow this additional upstream flow to continue without further restriction. During further consultation with Laura, it was felt that our approach was too simplistic and we were requested rather include the upstream flows from the Crayfern Development as per their approved restricted discharge rates and simulate these with the contributing areas per the information provided within their respective Discharge of Condition information. This information was included our detailed drainage strategy calculations, in the updated SuDS Statement from November 2019, and there are no longer two sets of calculations, just a single one.

The calculations are appended to this technical note as well as the drainage schematic from Windes for ease of reference. To confirm the hydraulic simulation has been carried out to account for all storm events up to and including the 1 in 100 year plus 40% event, with an additional inclusion of an extra 10% to accommodate future Urban Creep,

During the detailed design, the hydrobrake on SW10 was adjusted to 10l/s peak flow and overflow weir omitted as during the refinement of the detailed design these additional provisions were deemed unnecessary. The calculations enclosed reflect the 10l/s hydrobrake.

An exceedance flow layout has been included to demonstrate that the small volumes of surface flooding at the peak storm event can be safely contained on site without risk to people and property.

NOTES

Flood volume: 20m³ during peak storm event M100-2160+40% (+10% urban creep)
Flooded volume flows northwards into ditch system, re-enters and is contained within onsite surface water network

Flood volume: 1.686m³ during peak storm event M100-15+40% (+10% urban creep).
Flooded volume flows to low point in road and re-enters the surface water network via the proposed gullies at the low point.

Online Controls for SW-1.SWS

Hydro-Brake® Optimum Manhole: SCF-02, DS/PN: S5.001, Volume (m³): 2.0

Unit Reference	MD-SHE-0132-8000-1000-8000
Design Head (m)	1.000
Design Flow (l/s)	8.0
Flush-Flo™	Calculated
Objective	Minimise upstream storage
Application	Surface
Sump Available	Yes
Diameter (mm)	132
Invert Level (m)	3.960
Minimum Outlet Pipe Diameter (mm)	150
Suggested Manhole Diameter (mm)	1200

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	1.000	8.0
Flush-Flo™	0.302	8.0
Kick-Flo®	0.664	6.6
Mean Flow over Head Range	-	6.9

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)
0.100	4.7	1.200	8.7	3.000	13.4	7.000	20.1

100 year Return Period Summary of Critical Results by Maximum Level (Rank 1) for SW-1.SWS

Simulation Criteria

Areal Reduction Factor	1.000	Additional Flow - % of Total Flow	10.000
Hot Start (mins)	0	MADD Factor * 10m³/ha Storage	2.000
Hot Start Level (mm)	0	Inlet Coefficient	0.800
Manhole Headloss Coeff (Global)	0.500	Flow per Person per Day (l/per/day)	0.000
Foul Sewage per hectare (l/s)	0.000		

Number of Input Hydrographs	0	Number of Storage Structures	6
Number of Online Controls	7	Number of Time/Area Diagrams	0
Number of Offline Controls	0	Number of Real Time Controls	0

Synthetic Rainfall Details

Rainfall Model	FSR	Ratio R	0.350
Region England and Wales Cv (Summer)			0.750
M5-60 (mm)	19.000	Cv (Winter)	0.840

Margin for Flood Risk Warning (mm)	300.0
Analysis Timestep	2.5 Second Increment (Extended)
DTS Status	OFF
DVD Status	ON
Inertia Status	ON

Profile(s)	Summer and Winter
Duration(s) (mins)	15, 30, 60, 120, 180, 240, 360, 480, 600, 720, 960, 1440, 2160, 2880, 4320, 5760, 7200, 8640, 10080
Return Period(s) (years)	1, 30, 100
Climate Change (%)	0, 0, 40
