

Permavoid Sub-Base Replacement System

The Permavoid geocellular system is designed to be used in place of, or in conjunction with, a traditional aggregate sub-base, providing a **unique high strength, consistent structural raft** with all the benefits of a high voided modular geocellular structure.

The Permavoid system can be incorporated into the full range of traffic conditions, from domestic driveways to HGV applications, and is suitable below pervious and impervious asphaltic, block paved or concrete paved areas. The system complies with the requirements of **BS 7533-13** and incorporates a high vertical compressive strength of 715 kN/m² and lateral compressive strength of 156 kN/m².

Typical Permavoid Sub-Base Replacement System v Traditional Aggregate Sub-Base

Permavoid units are light in weight, 3kg per unit, and can be easily handled and transported. One truck load of Permavoid is equivalent to 21 trucks (20 tonnes) of aggregate.

Permavoid has a unique tapered jointing system that creates an interlocking raft. The raft transfers tensile stresses giving it exceptional strength that can support vertical loads in:

- Landscaped Areas
- Car Parks
- Service Yards
- HGV Areas
- Sport / Leisure Areas
- Green Roofs / Roof Gardens

Permavoid Sub-Base Replacement System Benefits

- Diurnal daytime storage tanks avoid deep excavations, thereby reducing cut and fill works onsite
- Health, safety and Construction Design Management (CDM) benefits associated with shallow, non-man-entry designs especially if contaminated ground conditions are present
- Reduction in storage requirements
- Protection by construction site
- No need for trench supports

Maximum Load for Structural Capacity Examples

Note: Site ground investigations are recommended in accordance with BS 7533:19:2009.
If CBR is below 5% an additional capping layer or geo-grid ground reinforcement is required.
