Dear Aelred "A" Kuppan,

Following my visit to look at the Sycamore tree in your front garden, I recommend the following...

The Tree has a branch growing north towards the house, currently this branch is approx. 6 meters in length from the main stem. Pruning this branch, taking off 1.5 meters, will give appropriate clearance from the house. Once pruned, this branch will measure approx. 4.5 meters from the main stem to its tip.

The tree is made up of 4 split stems, the stem growing to the east (out over the front lawn) is prominently longer than the rest of the canopy. The Stem in question is approx. 10 meters in length from the main union of the split to the tip, the stem then splits in to 4 branches at approx. 6 meters from the main union. These 4 branches need approx. 2 meters pruned off of each. This will leave the easterly stem approx. 8 meters in total length from the main union to the tips. This will improve the balance of the trees canopy and increase sunlight to the garden.

There are 3 telephone lines running through the Canopy, all 3 of these lines have branches rubbing. By removing rubbing branches to the nearest possible growth point the lines will be clear. None of the rubbing branches are major, the biggest being approx. 20cm in circumference.

Location of the
Sycamore.
