19th June 2021

Dear Sirs, I wish to make an objection to the planning application P/79/21/RES. Please record this letter objecting to above.

This application for a high density housing estate to be built on what is and has been for decades fine food producing agricultural land. The applicants now see it as only to be suitable for concreting over for ever. The reasoning seems to suggest that food production in this country is of no importance when we can rely, with contemptuous conceit, on other countries to feed us.

This application for 300 homes with the associated hundreds of additional car, transport and public services movements within this plot of land will create new high levels of air pollution. This area of land is surrounded by three roads

②

of high volume traffic use, already contributing to air pollution on an ever increasing scale.

The population increase of some 1000, men, women and children, over a short period of time will cause unsustainable problems to an already overstretched local health surgery and school. From where are the Doctors, Nurses, Dentists and Teachers going to be suddenly produced from? With absolute certainty it will not be of any concern to the construction company!

With the reduction in hedgerow and green space together with the amount of rain absorbent land being sacrificed for tons of concrete the risk of flooding will be greatly increased. The "once in a hundred years" rhetoric has been completely demolished by all the respected climate change scientists. With increased temperature and flooding issues now being forecast on an ever increasing scale and the recent report that "the U.K is woefully unprepared

to deal with Climate Change" should not this shocking indictment suggest that the planning application P/79/21/RES is strongly resisted under the current Climate Change Crisis that this country is now facing.
