

REASONS FOR PROPOSED TREE WORK

T1 English oak adjacent to pedestrian access:

- Shorten the lower lateral spread heading north and north west by 3m

Average current branch length	10.5m
-------------------------------	-------

Average finished branch length	7.5m
--------------------------------	------

- Suitable growth points will dictate the exact line of pruning
- Lateral prune to union 2-3 drooping branches on the western side of the tree

The northern and northwestern aspect of the tree is beginning to extend towards the neighbouring property; the pruning is intended to abate the spread whilst maintaining the aesthetic nature of the tree.
