Hi Brendan

Comments;

1. Please provide all the readings associated with the 13 minute percolation test ie. water level readings from 0 mins to 13mins, so the rate can be checked.
2. The storage calcs show a minimum soakaway depth of 1.944m being required. How can this be achieved based upon the design requirements. ie. soakaway base must not extend more than 2m below ground level and you also need to achieve adequate cover to the crates for protection.
3. Please show manhole cover/invert levels, including pipe invert at connection to soakaway.
4. Specify base level of soakaway ie. a level max. 2m below ground level.
5. Provide construction detail/section of soakaway (to include permeable geotextile wrapping).
6. Manhole SW4 is to be a catchpit (provide construction detail).
7. How is the driveway being drained? Provide full details/calculations.

I await your revised drawings, etc. Any queries please let me know.

Regards

Paul Cann

Dear Paul

Thank you for your e-mail below.

The chamber used to monitor ground water levels was excavated on the 4th January at approximately 11am (450mm wide by 2m deep by 3m long). There was no ground water evident in the chamber immediately after excavation. The chamber was inspected again 24hrs later and was dry. Therefore no ground water observed. Photos of the pit at the time of excavation and 24 hours later were sent to you earlier by e-mail.

The same chamber was then used to determine the infiltration rate as follows:

Test 1 – 75% to 25% 10mins

Test 2 – 75% to 25% 12mins

Test 3 – 75% to 25% 13mins

(The chamber used to measure infiltration rate was 450mm wide by 2m deep by 3m long using 500mm below ground level as the chamber-full datum).

Attached is our amended drawing and soakaway calculation show the soakaway size and position using the infiltration test results above.

As I understand it, the discharge of condition application was lodged previously and this is the last items to be signed off. Could you confirm that you have everything you need for the surface water sign off?

Thank you for your help and guidance with this.

Brendan Haworth

Hi Brendan

I note the percolation test results which are very good. Please forward the percolation test readings so we can check the infiltration rate, together with confirmation that groundwater was not encountered.

I look forward to receiving your design drawings (layout and construction details). Please note that the depth from ground level to the base of the soakaway must not exceed the depth of your trial hole.

Regards

Dear Paul

Andrew has just phone through the percolation test results.

Attached is the soakaway design taking into account the test results from today.

The soakaway is designed for 1 in 100 year event with 30% climate change.

You'll see the test results from today in the calculation sheet but for ease, they were:

Test 1 – 75% to 25% 10mins
Test 2 – 75% to 25% 12mins
Test 3 – 75% to 25% 13mins

If you are happy with the result then we can update the drawing and formally submit.

How do you want the results for water table monitoring and infiltration reporting?

Noted Brendan

Obviously the proposed formation level for the soakaways should not extend any deeper than your trial holes.

Subject: Walberton

Dear Paul

Andrew visited site this morning and has sent through the attached photos. Andrew reported that the pit is dry and no evidence of ground water.

The plan now, is to undertake the percolation test to establish the infiltration rate. I spoke to Andrew this morning and the three tests will be carried out on Monday once Andrew has located and filled a water bowser.

When we determined the infiltration rate we will update our calculation for the soakaway and update our drawings.

Will you want to see these documents before Mark Willis (architect) sends them to the case officer to discharge the planning conditions relating to drainage?

Brendan Haworth
