Tree Report

Location of Trees: Back Garden of, Little Burndell, West Walberton lane, Walberton, BN18 0QS

Tree Species: T1- English Oak

Areas of concern: This mature Oak is in great health however its lowest major limb spreading to the east is becoming a concern. It spans approximately 9 meters from stem to extremities, it has spread itself thin to reach the light and is now at risk of failing.

Solution: I propose reducing the extremities of this branch by 30% leaving it at a new length of 6 meters. Correct pruning cuts will be used to subtly reduce weight from the end of the limb, the aim will be to keep the tree looking as natural as possible whilst reducing risk of failure.

Copy and paste the section in red into the description of works box on the planning form.

T1- English Oak, Lowest major branch spreading to the east is at risk of failing due to its mechanical structure, reduce the extremities of this limb by 30%, current spread 9 meters, post work spread 6 meters, natural drop crotch pruning will be used, branch bark ridge and collar cuts will be used for quick recovery. Only this one limb will be worked on, the rest of the canopy will remain untouched.

Kind regards, Luke Bentley.
