Subject: Tactile Paving and Standing Water

Mr Moyo,

Whilst walking to the shops this morning I had a chance to look closer at the recent completed S278 works, unfortunately the tactile pedestrian crossing are not in specification, the radius kerbs should terminate at the blister paving and align fully, both will need to be rectified by adjusting the kerb line to full height to reach the paving.

The standing water is also a problem which is a shame as I witnessed the setting out engineer doing the levels survey for the surfacing so there should be no excuse.

It would be interesting to see the vehicle path tracking for this tight radius junction maybe the RSA3 will pick this up.

It is a shame as I made Andrew Howick aware of my concerns a few weeks ago when I noticed the setting out pins being wrong he assured me that you was aware of the issue and that of the new junction further down at Ford-water junction development.
